                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to 592 polynucleotides which have been derived from CC a variety of human tissue sources and which encode novel secreted CC proteins. The polynucleotides can be used as probes for the CC identification and isolation of full length cDNA and genomic DNA. The polynucleotides and proteins can also be used as nutritional supplements. The proteins are useful in the treatment of various immune deficiencies and disorders such as viral infections, bacterial infections, fungal infections, autoimmune disorders (e.g. rheumatoid arthritis, multiple cs clerosis, autoimmune thyroiditis and diabetes) and allergic reactions and conditions (e.g. asthma). They are also useful for treating neurodegenerative diseases (e.g. Alzheimer's disease, parkinson's CC and conditions (e.g. coagulation disorders (e.g. haemophilla), CC inflammatory disorders (e.g. Crohn's disease) and tumours. They are also useful for treating to burns, incisions and ulcers. The proteins are also useful for regulating the burns, incisions and for treating myeloid or lymphoid cell deficiencies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune disorder; rheumatoid arthritis; multiple sclerosis; tumour; autoimmune thyroiditis; allergic reaction; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; liver fibrosis; cancer; ulcer; coagulation disorder; inflammatory disorder; Crohn's disease; incision; tissue regeneration; wound healing; burn; haematopoiesis; myeloid cell deficiency; lymphoid cell deficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Five hundred and ninety two polynucleotides derived from a va-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               119and (TRELL). TRELL or active fragments can be included with a carrier in pharmaceutical compositions to treat cancer, autoimmune diseases or immune responses to tissue grafts, or to stimulate or suppress the immune system. It is useful to screen for TRELL receptors, by labelling with a detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for, can then be administered, optionally with interferon-gamma, to induce cell death or treat, suppress or alter immune responses (especially involving human adenocarcinoma cells) involving a signal pathway between TRELL and its receptor. The DNA sequence can be used in gene therapy for TRELL-related disorders in mammals (especially humans), e.g., tumours, autoimmune and inflammatory diseases or inherited genetic disorders, by introducing into cells, and expressing, therapeutically effective amounts of a vector, e.g. a virus comprising a gene encoding TRELL. It may also be of use in the preparation of prepare probes for screening natural/synthetic DNAs for TRELL-encoding sequences

                                                                                                                                                                                                                                                                                The present sequence encodes a human tumour necrosis factor (TNF) are lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosis in mammalian cancer cells, to induce NF-kappaB-dependent transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAX56000;

the isolation of human TWEAK receptor (TWEAKR)-expressing clones

of from a COS cell human cDNA library. The TWEAK protein is a

member of the tumour necrosis factor (TWF) family and induces

angiogenesis. TWEAKR may therefore be used to screen for and develop

TWEAKR agonists and antagonists for the modulation of angiogenesis, to be

used in the treatment and diagnosis of human disease. The disorders

mediated by angiogenesis include ocular disorders characterised by ocular

neovascularisation such as diabetic retinopathy, neovascular glaucoma,

retinoblastoma, retinopathy of prematurity, retrolental fibroplasia,

rubeosis, uveitis, macular degeneration and corneal graft

neovascularisation, and inflammatory diseases such as arthritis,

rheumatism and psoriasis. Other treatable diseases include malignant and

metastatic conditions such as sarcomas and carcinomas, benign tumours and

preneoplastic conditions, myocardial angiogenesis, haemophilic joints,
                                                        scleroderma, vascular adhesions, atherosclerotic plaque neovascularisation, telangiectasia, wound granulation, tatherosclerosis, peripheral atherosclerosis and ischaem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a DNA from the expression vector pDC409-LZ-TWEAK, which encodes a fusion protein comprising a grownorne leader, a leucine zipper multimerisation domain, and the extracellular domain of human TWEAK. The fusion protein was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page 39-40; 46pp; English.

New Tumor Necrosis Factor family receptor polypeptides and ligands useful for diagnosis and treatment of prostate cancer and developmental or gestational abnormalities
```

Example VII; Fig 13A; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) family CC receptor polypeptides: APO4, APO6, APO8 and APO9 or their active concern their active fragments, and isolated TNF related ligands 1 and 3 (TNRL1 and TNRL3) or their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic CC moiety. APO4 polypeptides are also useful for identifying selective CC binding agents, useful in diagnosis/treatment of disease by binding of CC agents to the polypeptide/active fragment which is extracellular, or CC expressed on the cell surface. The binding is preferably performed in CC vivo. APO4 polypeptides/active fragments are also useful for screening CC for agonists and antagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/active fragments and APO4 signal transducer molecules that specifically interact CC with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vivo or in vitro. APO polypeptides are all useful as immunogens for preparing antibodies. APO4 is also CC useful for diagnosis/treatment of developmental or gestational CC abnormalities. APO8 was transfected to human breast carcinoma cell line MCF-7, and induced apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated tumour necrosis factor polypeptide C (TNF). The polypeptide and polynucleotide are useful in controlling agriculturally important pests, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating epithelial morphogenesis, cell-matrix adhesion in flies and mammals. Thus the polypeptide and polynucleotide may be useful for treating, ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), centodoxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor variant 2 (TNFv2) protein, described in the invention.

Thus the polypeptide and polynucleotide may be useful for treating, ameliorating or preventing %-linked anhidrotic (hypohidrotic) ectodermal dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), endotoxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor variant 1(TNFvI) protein, described in the invention.
                                                                                                                                                                                                                                            (TNF). The polypeptide and polynucleotide are useful in controlling agriculturally important pests, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating epithelial morphogenesis, cell-matrix adhesion in files and mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Drosophila tumour necrosis factor molecule, useful in controlling agriculturally important pests, e.g. comprises modifying the growth, feeding or reproduction of crop-damaging insects or insects of farm animals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      H
                                                                    This cDNA encodes a murine RANKL, a ligand for the RANK (receptor care activator of necrosis factor-kappab (NF-RB)) polypeptide. RANK is a member of the tumour necrosis factor (TNF) family. A soluble RANK comember of the tumour necrosis factor (TNF) family. A soluble RANK contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to CR RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used to induce maturation of dendritic cells and enhance their colls and enhance their colls and enhance their colls and enhance their colluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists compose that result from triggering of RANK, e.g. in treating toxic response that result from triggering of RANK, e.g. in treating toxic contactons. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. RANKL polypeptides can also be used in flammatory of the colls of the colls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-OCT-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

On Nov 20, 2001 this sequence version replaced gi:16605765.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
                                                                                               complete sequence. AL603707
http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-422L16 is from the RPCI-23 Mouse PAC Library constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                                                            NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                             as soon as it is available and the accession number will be preserved.

It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Caps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
